

# TTM-339

PROGRAM CONTROLLER

TTM-339

# PROGRAM CONTROLLER TTM-339

#### COMPACT SIZE PROGRAM CONTROLLER WITH HIGH FUNCTIONALITY AND HIGH PERFORMANCE

#### **Features**

#### Program Controller Specifications

A liquid crystal display program controller with maximum of 15 patterns and 99 steps.

#### Full Multiple Inputs

The multiple inputs of Thermocouple (13 types) • RTD (2 types) • Voltage (5 types) • Current (1 type) input

#### Utilizes a liquid crystal display

- 1) The indication range has been extended to 5 digits
- ② Realized the various indication with 7 segments
- 3 Adopted LED for the back light

#### Backup and Initialization for the Setting Value.

#### Compact Size

A compact sized body with depth of only 65mm. In addition, the protrusion of the front panel is only 2mm when TTM-339 is mounted.

#### Loader communication function

It is best for the set up work of a complicated parameter peculiar to the program controller.

- · Cable: Option (sold separately)
- Software: Option (free) · · · it can be downloaded from our website (Under development).

#### Blind function

The system can be configured so that only the selected parameters are displayed from the set of parameters.

#### Manual control

A manual output function enables application of various instrumentation systems.

#### Communication function (RS485: TOHO exclusive protocol / MODBUS)

The cable can be extended up to the length of 500m, and can connect up to 31 units simultaneously. With one host computer, a centralized control such as "The collection of all data" and "Change of respective setting value" are possible from a distance place.

#### **Front Panel**

| Lamp character | Explanation  |
|----------------|--|
| PTN            | Lights while the Pattern is displayed                    |
| STP            | Lights while the Step is displayed                       |
| RUN            | Lights while the Program is in operation                 |
| OUT            | Lights while the Heating Output is turned ON             |
| EV1            | Lights while EV1 is turned ON                            |
| EV2            | Lights while EV2 is turned ON                            |
| EV3            | Lights while EV3 is turned ON                            |
| EV4            | Lights while EV4 is turned ON                            |
| TS1            | Lights while Time Signal 1 is turned ON                  |
| TS2            | Lights while Time Signal 2 is turned ON                  |
| TS3            | Lights while Time Signal 3 is turned ON                  |
| TS4            | Lights while Time Signal 4 is turned ON                  |
| AUTO           | Lights while the Auto is in operation                    |
| MANU           | Lights while the Manual is in operation                  |
| AT             | Lights in Auto-Tuning                                    |
| END            | Lights while the output is turned ON in using End Signal |
| TIME           | Lights while Time is set.                                |

| NO | Segment  | Explanation   |
|----|--|---|
| 0  | PV (5 digits)                                    | Displays PV, etc.   |
| 2  | SV (5 digits)                                    | Displays SV, etc.<br>0-fixed during pause<br>While the timer is in operation, 「TIME」is<br>displayed.                          |
| 3  | Pattern<br>(Lower case 2-digits Left)            | Displays a pattern number currently selected.   |
| 4  | Step digits<br>(Lower case 2-digits Right)       | Pause: Displays a step number of the pattern currently selected. In operation: Displays a step number which is performing now |
| 6  | Operation condition<br>(Lower case Center 6-SEG) | Displays a program operation condition  |

|   | Name of key switch    | Explanation                                      |
|---|-----------------------|--|
| 0 | Run/Hold key          | Used for Run/Stop and Pause, etc.                |
| 2 | Indication switch key | Used to change the indication, etc.              |
| 3 | Digit move key        | Moves setting digits leftward during the setting |
| 4 | Auto/Manual key       | Switches AUTO/MANU                               |
| 6 | Reset key             | Used for the screen reverse travel, etc.         |
| 6 | Selection key         | Used for the selection of the setting items      |
| 0 | ▽ key                 | Used for decreasing the values, etc.             |
| 8 | $\triangle$ key       | Used for increasing the values, etc.             |

#### **Description of Functions**

#### Wait function

It is a function to wait for the time course of the next step when PV doesn't reach the wait zone after the transition from the present step to the next step.

Waits until the maximum wait time.

The different wait conditions can be set by selecting the wait functions 1 to 4. When it is set to "0", the wait continues until PV exceeds SV.

#### Auto-tuning function

The auto-tuning starts at each point of Low/Medium/High temperature. The temperature, to which the auto-tuning is performed, is set on the respective start screen and the auto-tuning is started by pressing the RUN/HOLD key. AT-1 ( $\sim$ 3)/PV is alternately indicated on the PV display digits during the auto-tuning.

The auto-tuning is stopped by pressing the RUN/HOLD key again.

#### PV start/SV start

PV start The operation starts at the ramp step of the rising slope which includes the measurement temperature. In addition, the operation starts from the elapsed time, assuming that the time has elapsed until the start point. The start point is calculated from 0°C /0 digit. The operation is started by the elapsed time 0 minutes if below 0°C /0 digit.

**SV start** The program operation starts according to the PV start temperature setting.

#### Digital PV filter

It is a function to realize the CR filter effect on the software by performing primary delay operation to PV of input 1. The effect of the filter can be set by the time constant. (Time constant is the time it takes for the PV value to reach up to about 63% when the input changes in step pattern.)

≪CR filter…Primary delay filter

The use of Digital PV filter:

- 1 Removal of high frequency noise... The noise effect is minimized when the electrical noise is added to input.
- ②A response can be delayed against the sudden change of the input.

#### Manipulated variable current limiter

This function divides SLL to SLH into 10 segments and performs the manipulated variable limit and current value limit at respective points. The limit of manipulated variable is performed by calculation result in the manipulated limiter points 1 to 11. In the current limiter points 1 to 11, if the measurement current value exceeds the (setting value-current limiter sensitivity) of respective points, the manipulated variable at the current value limiter point is computed from the measured current value and the present manipulated variable, and the manipulated variable limit is performed from the computed manipulated variable. This manipulated variable changes every time the current value is measured. And, the final manipulated variable performs the limit by the smaller one of the two above.

- $\boldsymbol{\cdot}$  Calculated by the manipulated variable and the current value of SLL in case the input
- Calculated by the manipulated variable and the current value of SLH in case the input is over the table range

#### e.g.) When the various settings and PV are as follows.

PV=120°C, manipulated variable limiter point 2=75.0%, current value limiter point 2=75A, present manipulated variable=60 %, AMAX=200A (equivalent to 0 to 5.0A), AHC=10A

(When measurement current value=100A)

The manipulated variable of the current value limiter point 2 (75A)-the current limiter sensitivity (10A) is calculated by the interaction between 0 to the present manipulated variable (60.0%)=0 to measurement current value (100A). The manipulated variable is 45.0% according to the calculation.

#### Pattern/Step setting

The following fixed step numbers are set by the pattern numbers about step numbers.

| Pattern number     | Step number |
|--------------------|-------------|
| When 1 is selected | 99 steps    |
| When 2 is selected | 49 steps    |
| When 3 is selected | 33 steps    |
| When 4 is selected | 24 steps    |
| When 5 is selected | 19 steps    |
| When 6 is selected | 16 steps    |
| When 7 is selected | 14 steps    |
| When 8 is selected | 12 steps    |

| Pattern number      | Step number |
|---------------------|-------------|
| When 9 is selected  | 11 steps    |
| When 10 is selected | 9 steps     |
| When 11 is selected | 9 steps     |
| When 12 is selected | 8 steps     |
| When 13 is selected | 7 steps     |
| When 14 is selected | 7 steps     |
| When 15 is selected | 6 steps     |
|                     |             |

#### Communication function (inclusive of Loader Communication)

#### A connection example with the personal computer

Centralized supervision with the personal computer would be possible with the connection like the chart below.

#### **Loader communication**

#### [Standard and performance]

|  | USB I/F standard                   | USB Specification 2.0 Compliant                          |  |  |
|--|------------------------------------|--|--|--|
|  | DTE (Personal computer side) speed | Up to 38400bps   |  |  |
|  |                                    | Personal computer side: USB                              |  |  |
|  | Connector specification            | Temperature Controller side: $\varphi$ 2.5mm Stereo plug |  |  |

[Model] TTM-LOADER

#### Power failure function

In the event of power failure during which the unit had been in operation, the setting of the unit can be restored back to the time right before the power failure but on the following condition. However, if the PV at the time of recovery is outside the range of PV±Power Failure Recovery Temperature, operation will be in stop condition when it recovers. The alarm condition of Event function will be also restored back to the time right before the power failure.

- 1) When step 1 is in timer operation condition (SV=SLL) → Restores up to the point when the power failure occurred
- 2) During the ramp of SV increase or in soak → Restores with PV start Restores with the operation-end "END" when there is no SV.
- 3) During the ramp of SV decrease or while in soak after decrease → PV>Restores with PV start in the decreasing step in case of the decreasing point. PV≦Restores with the operation-end "END" in case of the decreasing point
- 4) While in  $E \cap d \rightarrow \text{Restores to END}$
- 5) Restores with pause when the power failure occurred during pause while in conditions mentioned in 1) to 3)
- 6) When in manual operation  $\rightarrow$  Restores with stop condition.

#### • Auto operation (AUTO)/Manual operation (MANU)

The auto control and the manual control can be switched with the front key. Manual operation is a function in which the control output (manipulated variable) can be set and output the power manually regardless of the deviation condition. The system can be operated manually when performing operation check of the control-end (valve, heater, etc.) during the system trial run, or when normal control cannot be done due to sensor trouble, etc. Further, the switching can be done at ease as it is equipped with Balance-less Bumpless function which suppresses the sudden change of control output when switching the automatic control and manual control reciprocally and also prevents damage on the peripheral equipment as a result of sudden change and adverse effect to a control system.

#### Blind function

#### Time signal output

When each steps start, and after the ON delay timer is lapsed, the time signal output 1 to 4 are turned ON. Next, the output is turned OFF after the OFF delay timer is lapsed. The corresponding TS1 to TS4 lamps light when each time signal output is turned ON.

The function selections 0 to 5 of TS1 to TS4 are selected at each step, the above mentioned operation is performed by setting value in case of 1 to 4, the function is none when 0 is selected, the time signal output is always turned ON in the selection step when 5 is selected.

The output is returned till the returned point when the time is returned by  $\triangle \cdot \nabla$  key after the time course, and then the count is started from that point. (It's from the halfway.)

e.g.) After 3 minutes from the time the OFF delay ends, the output is turned ON and the OFF delay is counted for 2 minutes when the elapsed time is reversed 5 minutes back by  $\nabla$ key.

#### OFF point position movement of ON/OFF control

When the OFF point position movement is set to 0, the OFF point is the set value position.

This is when off point position movement is set up with (+5). In the actual specification, there is no description change as above, but move above equal to (+5) as a position of ON/OFF.

When moved to negative side, the OFF point moves to opposite side to description above.

#### Signal output during operation/End signal output function

#### Signal output during operation

The relay output as the "signal output during operation" is always turned ON while in operation.

#### **End signal output**

The output as the End signal output is turned ON/OFF by the following flow when the program operation ends. The output is turned ON till 5.3.1 reset condition when the End signal ON time is set beyond the maximum of setting range ( $\lceil ----- \rfloor$  indication). The End lamp also lights.
